Olabiyi Olaleye

Software engineer, full-stack and data

Lagos, Nigeria (open to remote) | olabiyi.olaleye23@gmail.com | +234 806 424 0875 | LinkedIn | Portfolio | GitHub

SUMMARY

Software engineer with six years of experience building React, Next.js and React Native applications, most of them products that take payments and manage bookings in Nigeria. A normal week means TypeScript on the front end, Node behind it, and a fair amount of SQL when production data stops adding up.

My background is Economics and Statistics, and the analysis side has stayed with me. I build dashboards in Power BI and Excel, hold the Google Data Analytics Professional Certificate, and use SQL to find out why a payment, a booking or a loan record ended up in the wrong state. I am looking for a full-stack or data-focused engineering role where both skills get used.

SKILLS

Languages and frameworks: TypeScript, JavaScript, React, Next.js (App Router), React Native with Expo and Expo Router, Redux Toolkit, React Query, Node.js, Express, NestJS, HTML5, CSS3 and SASS, Tailwind CSS, Bootstrap

Data and analytics: SQL (joins, CTEs, window functions, conditional aggregates), Power BI, Tableau, R, Python (working knowledge), Excel with macros, data validation, dashboard design

Backend and databases: PostgreSQL, MySQL, MongoDB, Supabase (row-level security, auth, storage), REST APIs, Paystack, Monnify and Stripe payment flows (frontend), Upstash Redis

Tools and process: Git, GitHub, Azure DevOps (Boards and Pipelines), Turborepo, Vercel, Postman, Sentry, Figma, React Testing Library. Agile and Scrum, with work planned as epics and issues in Azure Boards

EXPERIENCE

Software Developer, NimbleByte Global

May 2022 to present

Lagos, Nigeria (remote)

Full-stack work across the company's platforms, on web, mobile and backend. Most of it has gone into NimbleBash, the JV Deal Management Platform and NimbleFinance, with further work on NimbleGRC and NimbleCasa.

- NimbleBash is an event platform with a React web admin and a React Native app. Guests buy or claim tickets, hosts run the event, and ushers check people in at the door with QR codes. I built and fixed features on both apps, including the check-in flow (one QR payload format shared by web and mobile), digital tickets, usher approval, free and paid ticket claiming, and the frontend of the Paystack, Monnify and Stripe payment flows.
- Fixed the role problems in the mobile app: roles now survive an app refresh, a user who is host, guest and usher can switch between them with a confirmation step, and the tabs were restructured per role on Expo Router. Audited the mobile UI on a Xiaomi 13T, rewrote the responsive utility around a breakpoint chain, and fixed modal close-and-reopen race conditions and Android push notifications that opened the wrong screen.
- Added features that Nigerian events ask for: AsoEbi attire modals, cash gifts, map rendering for events that run over several dates, event pages for signed-out visitors, and a default-password flow for guests with temporary accounts.
- On the React web admin, built event approval with configurable service charges and server-side filtering on the explore page, fixed CSS responsiveness across many components, and converted shared pieces from React Native to React so web and mobile behave the same.
- NimbleFinance is a lending platform for the Nigerian market, built on Next.js and deployed through Azure. I worked on the credit-registry integration, data models for BVN, NIN and CAC records, a reporting engine for credit data and loan officer assignment, and tracked down a cross-site cookie bug that was breaking authentication.
- Contributed as part of a team to NimbleGRC, a multi-tenant governance, risk and control platform (NestJS, MongoDB, Turborepo, Azure DevOps CI/CD), and to NimbleCasa. Also worked on the JV Deal Management Platform (MERN stack, TypeScript).
- Built the frontend of the Shortlet Booking Platform, a marketplace that connects hosts with guests, in React, Redux and CSS3. Search and filtering by location, dates, amenities and price is debounced, and I used SQL over the booking, transaction, account and audit tables to trace user-reported issues and compare API payloads with the stored values.
- Took part in incident investigations and root-cause analysis. Most of the work was SQL: following a booking or payment through the transaction tables, finding where it stopped, and catching missing records and duplicates before users did. In QA I used CTEs and temporary tables to walk through multi-step flows such as booking, payment validation and status changes.
- Work in Agile sprints. Plan sprints and review technical decisions with engineering managers, break features down into epics and issues in Azure Boards, and agree requirements and delivery dates with product managers and designers.

AI Evaluation and Data Annotation (contract) 2025 to 2026

- Rated text-to-speech audio and AI-generated images against written quality guidelines, and compared videos for quality.
- Did bounding-box and audio annotation, and assessed model responses.
- Passed quality checks on several task types, including furniture removal, sketch-to-photorealistic conversion and computer-use tasks.

Frontend Developer, Korpea Technology May 2020 to Aug 2022

USA (remote)

- Built production pages in HTML5, CSS3, JavaScript, jQuery and AJAX for a US company, working remotely from Nigeria, with layouts that held up across desktop and mobile devices.
- Used AJAX to fetch and update data on the page without full reloads, and moved parts of the interface to React to handle real-time updates and asynchronous data fetching from the backend.
- Built layouts, navigation structures and page templates, and presented design drafts to managers and clients for approval.
- When users reported bugs, reproduced them with real records and joined the booking, payment, account and state-transition tables in SQL to see where the data went wrong.
- Tested in Chrome, Firefox, Edge and Safari and fixed the differences between them, so each feature behaved the same in every browser.
- Wrote user stories and acceptance criteria with product owners so the team agreed on what done meant for each feature.
- Broke features into tasks with engineering leads, raised blockers early, and gave feedback in design reviews to keep the UI, performance and data needs in line with product goals.

Sales and Marketing Representative, First City Monument Bank May 2019 to Apr 2020

Nigeria

- Wrote Excel macros that automated routine reports and cut reporting time by 50%.
- Ran customer segmentation analysis and adjusted marketing to fit the segments, which raised customer engagement.
- Developed sales strategy aimed at high-net-worth individuals and businesses, and promoted the bank's products to a range of audiences, and met and exceeded sales targets.
- Coordinated marketing events and community campaigns to raise brand awareness.

Earlier roles

Economics Teacher, Glorious Light Academic (part-time, Sep 2016 to Dec 2018). Built an Excel system for tracking student performance, which improved evaluation efficiency by 40%, and analysed results over time to adjust lesson plans.

IT Student, Planning, Monitoring and Budgeting Department, Obafemi Awolowo University (Mar 2014 to Jan 2015). Compiled and analysed budget data, tracked matriculation and convocation trends, and prepared annual reports for government agencies.

PROJECTS

Wedding Photo Platform (personal project)

A single-page web app I built for my own wedding, where guests uploaded photos from the day. It is live, and I am now upgrading it. Next.js, React, Supabase (Postgres, auth, storage), Upstash Redis rate limiting and Sentry.

Evermora (personal project, in development)

A mobile-first web app for creating and sharing online memorials, with a public memorial site, a private family dashboard and an admin app. Next.js, React, TypeScript, Supabase and Vercel.

SendIt (client project, in development)

An on-demand delivery marketplace for Nigeria, with customer, rider and admin Next.js 15 PWAs, Paystack payments and Google Maps.

Data projects: SQL analysis of 120,000 Brazilian e-commerce records in MySQL (public dataset). Power BI sales report for a Nigerian vintage retailer (case study). Excel dashboard on data science salaries (public dataset and case study).

EDUCATION AND CERTIFICATION

Google Data Analytics Professional Certificate, Google. Eight courses with hands-on assessments covering spreadsheets, SQL, Tableau and R, and the full cycle of preparing, processing, analysing and sharing data.

B.Sc. Economics, Obafemi Awolowo University. Second Class Honours (Upper Division), 2019. Coursework in macroeconomics, microeconomics, econometrics and statistics.

ND Statistics, The Polytechnic, Ibadan. Upper Credit, 2013. Probability, regression analysis, data collection and cleaning.
